Energy Calculating System:

In today's modern world, machines perform a variety of work leaving very little scope for manual labor. Hence, knowledge about the type and amount of energy is of paramount importance. The most commonly used one is the electrical energy. In this context we will design a electric circuit to run an appliance/device and calculate the energy utilized for efficient functioning of the appliance. The formula to calculate energy is Energy = Power * Time. Electrical, Mechanical, Programming skills, reKam1 technology will be used to execute the project.
