Build your own Online Calculator

The objective of this project is to learn how to write a simple calculator with the JavaScript programming language.

We will build a simple web application to add, subtract, multiply or divide two numbers. Technology used will be HTML and CSS for design and JavaScript for calculation logic. We would also learn the concept of input validation and apply it on the input parameters.

User will be given an option to choose the kind of operation to be performed and enter the parameters. Our code will perform the calculation and display the result or error messages.
