Abstract:
I'll discuss many of the ways in which I and my colleagues from school and previous employers have put our academic backgrounds to work in "the real world." In addition to numerous examples from my current involvement in venture capital, I shall discuss mathematical and scientific applications in banking, airlines, and telecomm. A graduate degree is not an end unto itself, but rather the beginning of a grand and glorious experience. That experience need not find root solely within the confines of a university; it can take root equally well (and with great results) in industry. Moreover, there are plenty of great careers awaiting a good scholar that do not require an MBA as the price of admission (!).
